# Part I

## Math

### 1 Linear Algebra

#### 1.1 Matrix Operations

The **addition** and subtraction of matrices happens element-wise. Take two  $2 \times 2$  matrices  $A$  and  $B$ :

$$A + B = \begin{pmatrix} a_{11} + b_{11} & a_{12} + b_{12} \\ a_{21} + b_{21} & a_{22} + b_{22} \end{pmatrix} \quad (1)$$

The multiplication operation is known as the **dot product**.

$$A \cdot B = \begin{pmatrix} a_{11}b_{11} + a_{12}b_{21} & a_{11}b_{12} + a_{12}b_{22} \\ a_{21}b_{11} + a_{22}b_{21} & a_{21}b_{12} + a_{22}b_{22} \end{pmatrix} \quad (2)$$

The division operation does not exist for matrices. There is no inverse operation to the dot product. Note that matrix multiplication is *not commutative*. Multiplication is carried out right to left.

$$ABC = A(BC)$$

The equivalent concept to “dividing away” on two sides of an equation is to right-multiply an inverse.

$$B = ADC$$

The **transpose** of a matrix is flipped along its diagonal. Where the matrix is not square, this diagonal is imagined. For example given the  $2 \times 3$  matrix  $C$ :

$$\begin{pmatrix} c_{11} & c_{12} & c_{13} \\ c_{21} & c_{22} & c_{23} \end{pmatrix}^T = \begin{pmatrix} c_{11} & c_{12} \\ c_{21} & c_{22} \\ c_{13} & c_{23} \end{pmatrix} \quad (3)$$

#### 1.2 Inverse

The **inverse** of a matrix should satisfy  $AA^{-1} = I$ . The inverse is also the reciprocal of its determinant.

$$A^{-1} = \frac{1}{|A|} \quad (4)$$

For any  $n \times n$  matrix, the inverse can also be found via Gauss-Jordan elimination. When the LHS is reduced to  $I$ , the RHS is the inverse of  $A$ .

$$\left( \begin{array}{ccc|ccc} a_{11} & a_{12} & a_{13} & 1 & 0 & 0 \\ a_{21} & a_{22} & a_{23} & 0 & 1 & 0 \\ a_{31} & a_{32} & a_{33} & 0 & 0 & 1 \end{array} \right) \quad (5)$$

#### 1.3 Determinant

#### 1.4 Cross Product

The **cross product** is a new operation to matrices. For a  $2 \times 2$  matrix, the cross product is the same as its determinant.

$$A \times B = \det A - \det B = a_{11}a_{22} - a_{12}a_{21} - (bb - bb) \quad (6)$$

The cross product is more meaningful for matrices  $3 \times 3$  or bigger.

$$A \times B = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \end{vmatrix} \quad (7)$$

## 1.5 Square Matrices

A **diagonal matrix** is a square matrix which is comprised of non-zero values along the diagonal and zeros everywhere else. The **identity matrix** is a square matrix with 1's on the diagonal.

$$I = \begin{pmatrix} 1 & 0 & \cdots & 0 \\ 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 1 \end{pmatrix} \quad (8)$$

## 1.6 Eigenvalues and Eigenvectors

## 2 Calculus

### 2.1 Derivative and integral foundations

### 2.2 Multivariable Topics

## 3 Probability

### 3.1 Probabilitly foundations

### 3.2 Markov Chains

### 3.3 Renewal Processes

## Part II

# Computer Science

## 4 Object Oriented Programming

This section will mostly be covered in Java, with analogies drawn to Python. This section will cover:

- Scope and encapsulation
- Polymorphism

### 4.1 Java foundations

```
class MyClass{  
    private int x = 123;  
  
    public MyClass(int a) {  
        ...  
    }  
}
```

wtf? hello

### 4.2 Scope & Encapsulation

## 5 Data Structures & Algorithms

## 6 Machine Learning

## Part III

# Finance

### 7 Fixed Income
